

Radar Dashboards from Synchronology give you real-time visual reporting.

One of the biggest pay-offs of automated process management in Singlepoint is access to instant and real-time data analysis and management reporting, and it does not get any better than **Singlepoint Radar**. Leave your old manual methods of management reporting in spreadsheets behind and save precious time with instant reports and benefit from data in real-time. This powerful over-arching reporting tool is fully integrated into Singlepoint's data management architecture, which means you can build powerful, drillable dashboards and reports and even link Radar to non-Singlepoint data sources.

The Business Problem

In our experience, we have found that many businesses struggle to combine all of their data into one place as the number of systems they use are multiplying. They have one system for ERP, a separate Quality system, a T&A system, a Maintenance system, spreadsheets to record and track key measures, overall a nightmare to pull such different data sources into one place, let alone analyse the results.

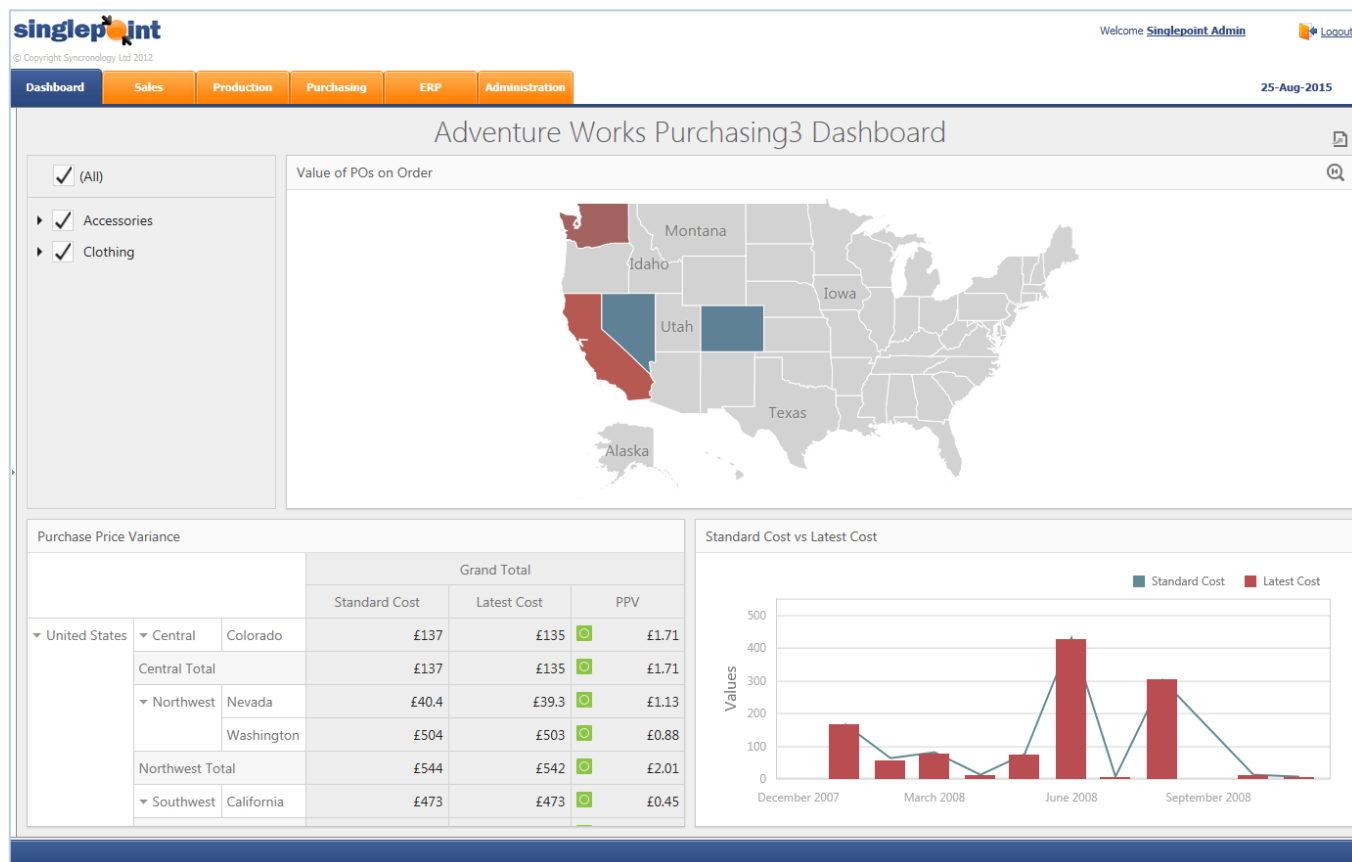

Managers become frustrated as their data needs are not met.

IT departments are under increasing pressure to respond and meet data requirements.

Individual departments are left blind as to their performance, opportunities are missed and the general culture becomes reactive to problems instead of the desired proactive approach sought.

The Solution

Welcome to the Radar Dashboard solution. An easy to use business intelligence detection tool for executives and business users which connects itself to a multitude of data sources (not just Singlepoint data) to display data visualisation elements (Chart, Pivot table, Data Card, Gauge, Map or Grid).

Call **01628 421829** now to arrange your free product demonstration or email enquiries@synchronology.co.uk

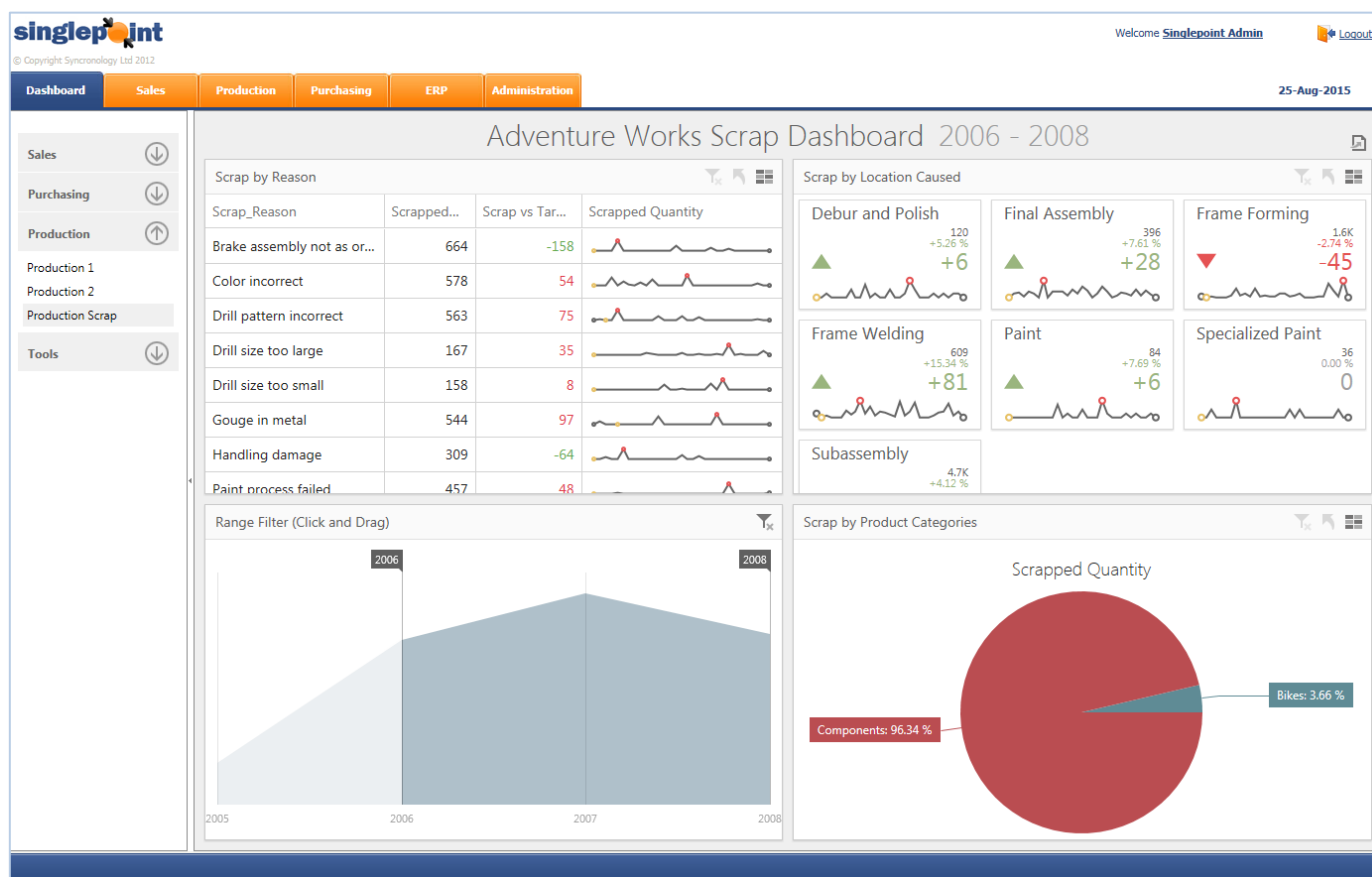

Managers now have a one-stop dashboard for their information needs, providing insightful and information rich decision support systems.

IT departments will be relieved of the data requirement pressures and can concentrate their efforts on more value added activities as users are empowered to meet their own data needs.

Individual departments will find the Singlepoint Radar Dashboard solution easy to use, as creating their own dashboards is a simple matter of selecting the appropriate UI element and dropping data fields onto relevant arguments, values and series. Results are immediate, accurate and relevant.

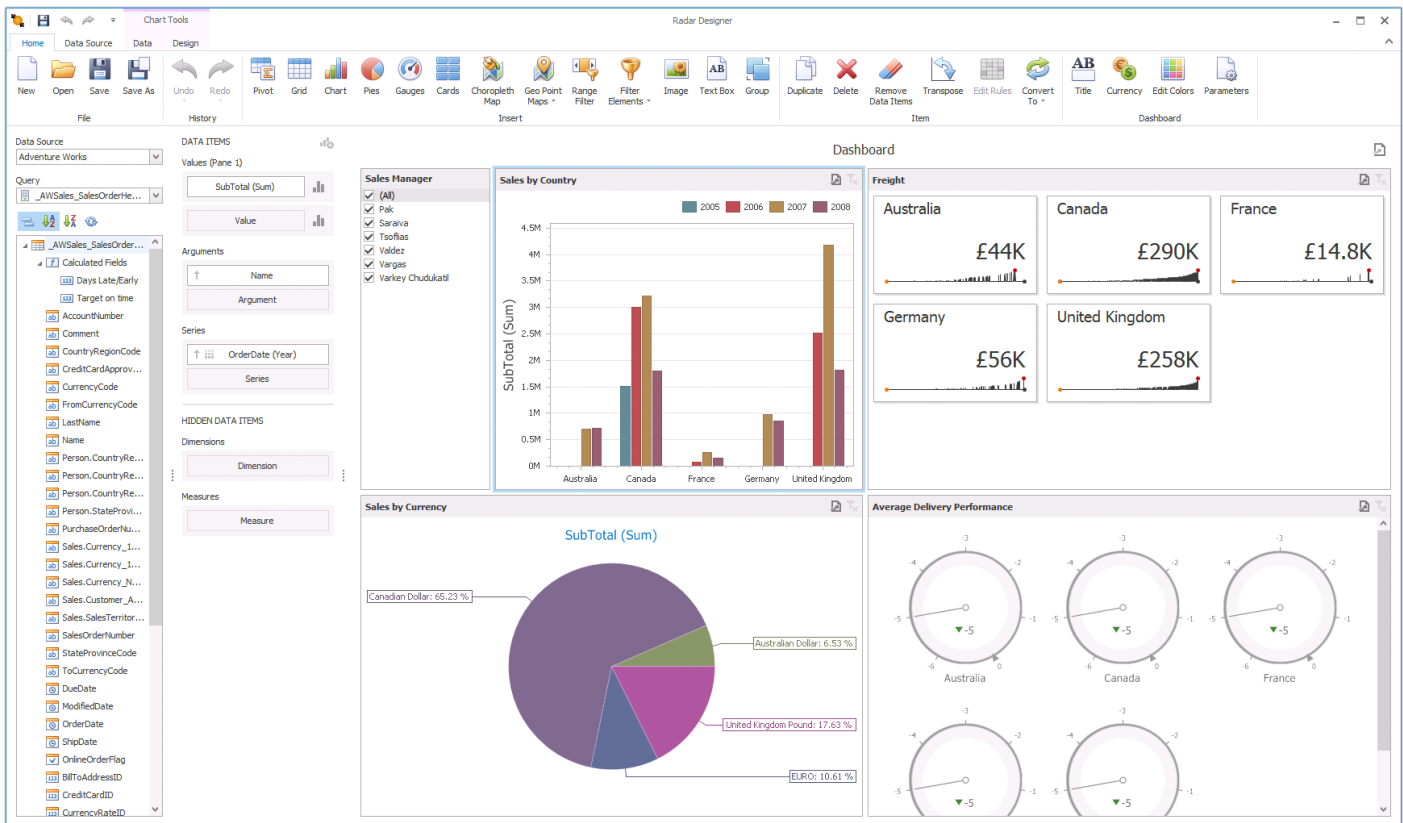

Seamless Integration with Singlepoint

Within Singlepoint, users view the Radar Dashboard Solution from the relevant tab or within workflow itself. A collapsible, structured menu system helps the user navigate to the required dashboard, and in one click the user has a fully flexible, interactive and customisable dashboard displaying real-time data.

Call **01628 421829** now to arrange your free product demonstration or email enquiries@synchronology.co.uk

For developers, Radar Dashboard has an additional Tools menu that will launch the Radar Designer, enabling effortless editing and creation of visually appealing dashboards. Simply link to a data source, select the required UI element then drag and drop fields needed.

Any Data Source, Anytime

Radar has an easy-to-use binding wizard that connects to a multitude of different database engines, it is not just limited to Singlepoint data.

The following data source list is not exhaustive:

- | | | |
|-------------------------|-----------------|----------------------|
| MS SQL Server | Amazon Redshift | SAP Sybase Advantage |
| OLAP | Teradata | SAP Sybase ASE |
| MS Analysis Services | Firebird | SQLite |
| Entity Framework | IBM DB2 | VistaDB |
| Microsoft Access | MySQL | VistaDB 5 |
| Microsoft SQL Server CE | Pervasive PSQL | XML Files |
| Oracle | PostgreSQL | |

UI Elements

Radar Dashboard contains 8 dynamic dashboard UI elements, 2 static presentation items and 4 filter elements:

In addition to the above, there are also image and text box items available to display static images or text within the dashboard.

Data aware dashboard items can interact with each other, providing filtering capability to other UI elements on the same dashboard. Additionally some elements have drill-down functionality for more in-depth investigation and analysis, as well as conditional formatting to make those important numbers stand out.
